Precipitate Gold Corp.

Business: Exploration and development of gold, silver, and copper properties in the Dominican Republic and Mexico

Traded Toronto: PRG
 USOTC: PREIF
 Initial Recommendation 4/11/14: US\$0.155
 Shares Outstanding: 38,051,658
 Price 1/9/15: \$0.14
 Market Cap: \$5.3 million
 Approximate Cash Resource: \$600,000
 Progress Rating: A4
 Telephone: 604-558-0335
 Web Site: www.precipitategold.com

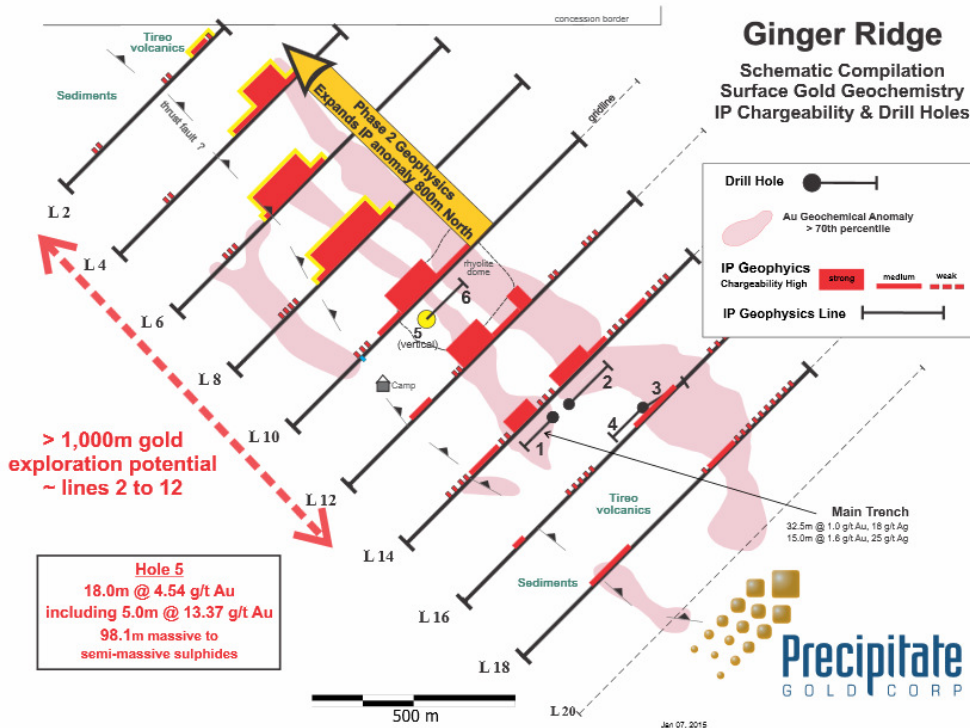

Over the past few years since the price of gold peaked in 2011, one of the better exploration success stories has come from the Romero Project in the Dominican Republic operated by GoldQuest. That project has some 2.38 million gold-equivalent ounces in the indicated category and another 790,000 ounces in the inferred category. The company is fast-tracking that project toward a production decision with an aggressive exploration program in 2014 that could lead to still a larger project.

Before David Coffin's untimely and sudden death, he and his brother, Eric, whom I consider a good friend, were involved in putting together Precipitate Gold Corp., for the purpose of exploring some ground in the vicinity of the GoldQuest discovery. Those plans were barely getting off the ground when David left us, but in his memory and perhaps in honor of him, a group of exploration professionals have determined to give their best shot for Precipitate Gold's success. The really good news is that I can happily report that Precipitate Gold has had considerable success on its Ginger Ridge Property such that I

think this stock has a very good chance at turning a tenfold profit for folks who buy these shares at their current price. The odds of that happening of course improve with a cooperative gold share market. But to generate lasting value, an exploration company has to establish mineral wealth in the ground.

Regarding that prospect, the news appears to be very good. Although Precipitate does not yet have a resource calculation, based on surface exploration results combined with a discovery drill hole, that being Hole #5, the odds seem to favor some very positive excitement for this company and its shares in 2015.

The chart on your left displays surface gold geochemistry along with IP chargeability and drill holes. As noted previously, both the geochemistry and IP chargeability on this property correlate very well, which adds to exploration confidence.

The chargeability seems to be getting stronger to the north (toward the top of the chart) and in the discovery hole, Hole #5, which graded 18 meters of 4.54 g/t gold, was on the northernmost chargeability point when the hole was drilled.

The question was how much further would this

geophysical anomaly run. On Jan. 7, management released the latest chargeability results and they are better than good. The anomaly not only extends for a total strike length of 1,000 meters but it is also getting stronger and wider to the north. Thus it seems likely that this company's drill program this year, which is now being established on the basis of the latest information, will likely bring some good news for investors this summer.

At last report, the company had working capital of about \$800,000, which isn't much. I'm guessing they will need to raise some more capital at some point during 2015 as long as they continue to remain active, which I believe is management's intention. But I wanted to point out to you that I think this little penny stock with a market cap of a measly US\$5 million has a real good chance of providing great returns for those who buy these shares at current levels, especially if, as I believe, we are heading into much more favorable environment for junior mining stocks.

I should mention that this stock is Eric Coffin's to pick for 2015, as he explained recently on my radio show, which you can listen to here: <http://jaytaylormedia.com/audio/>.
